**Abstract** – Analysed the literature sources to establish the basic "scaffolds", necessary for the design of "drug-like molecules." Created the combinatorial library of new heterocyclic derivatives of 1,4-naphthoquinone. A docking study for determining structure leaders was conducted, ways of optimization the chemical structures to enhance the biological activity were determined. Designed by methods of obtaining a new heterocyclic derivatives based on 1,4-naphthoquinone and conducted search including effective anti-cancer agents.

Key words – heterocyclic compounds, 1,4-naphthoquinones, azomethines of  $\alpha$ -amino acids, anticancer agents, "drug-like" compounds, 1,3-dypolar cycloaddition reaction.

## I. Introduction

In the modern society one of the main items is the system of health care. On the background of adverse social and environmental conditions etiologic and pathogenic factors, arise to the development and evolution of various diseases. This situation requires modernization treatments, the most common of which is chemotherapy (therapy by medicinal products).

Mentioned above requires continuous updating and improvement of drugs for the treatment of pathological conditions, contributing to the development of synthetic chemistry, namely in the synthesis of new biologically active compounds. [1,2]

Heterocyclic Compounds (mainly derivatives of heterocycles) is extremely widespread in wildlife and perform a variety of biological functions. These compounds account for about 50% of natural substances, including biologically active compounds (it's a part of chlorophyll, hemoglobin, vitamins, alkaloids, nucleic acids, enzymes, etc.). Also exhibit moderate antitumor, aperient, astringent, anti-inflammatory and bactericidal action. [3-9]

Most of these compounds are used as medicines or as starting materials for the synthesis. Due to heterocyclic compounds the arsenal of synthetic drugs is continuously replenished.

## II. Result and Discussion

In recent decades, a lot of attention is paid to obtain new heterocyclic compounds with a wide range of biological activity.

A promising research direction of modern organic and pharmaceutical chemistry is directed synthesis and

investigation of chemical, physico-chemical and biological properties of new heterocyclic compounds based on 1,4-naphthoquinone.

Research in the field of quinoid compounds made significant contribution to the theoretical basis of organic chemistry, and made it possible to detect many substances that exhibit different biological activities (biocide, antibiotic, antioxidant, etc.). [10-16]

Also, the presence in the structure of compound fragment of quinone provides a high degree of bioavailability.

Important is to develop a method of constructing conjugate of one or more heterocyclic rings with the quinoid fragment, as most ligands for biological targets are compounds of heterocyclic structure. Therefore, in our opinion, the combining in one molecule quinoid and heterocyclic rings will lead to the formation of new heterocyclic systems based on 1,4-naphthoquinone – potential biologically active substances.

The aim of this work was the synthesis of new heterocyclic derivatives of 1,4-naphthoquinone with substituted pyrrole moiety. The task was implemented using 1,3-dypolar cycloaddition reaction by reacting the corresponding of azomethines  $\alpha$ -amino acids with 1,4-naphthoquinone molecules in the medium of toluene in the presence of silver acetate and the base. Obtaining of the product was carried out in three stages.

The first step was to obtain methyl esters of  $\alpha$ -amino acids. The reaction was carried out in methanol in the presence of thionyl chloride, which form an acidic medium and is used as a dehydrating agent. Using of esters avoid polymerization of amino acids in the synthesis of azomethines.

The next stage was to obtain azomethines in toluene with azeotropic stripping of water, formed in the reaction (1):

The third stage was carried out for obtaining the target product by dipolar cycloaddition of azomethines of  $\alpha$ -amino acids with 1,4-naphthoquinone in toluene, in the presence of silver acetate and triethylamine (2):

## Conclusion

The article describes the main ways of synthesis of potentially biologically active compounds from 1,4-naphthoquinones. A docking study for determining structure leaders was conducted, ways of optimization the chemical structures to enhance the biological activity were determined. Designed by methods of obtaining a new heterocyclic derivatives based on 1,4-naphthoquinone and conducted search including effective anti-cancer agents.
